

## Company Example Database

### Overview

The company wishes to create a database to keep track of a company's employees, departments and projects.

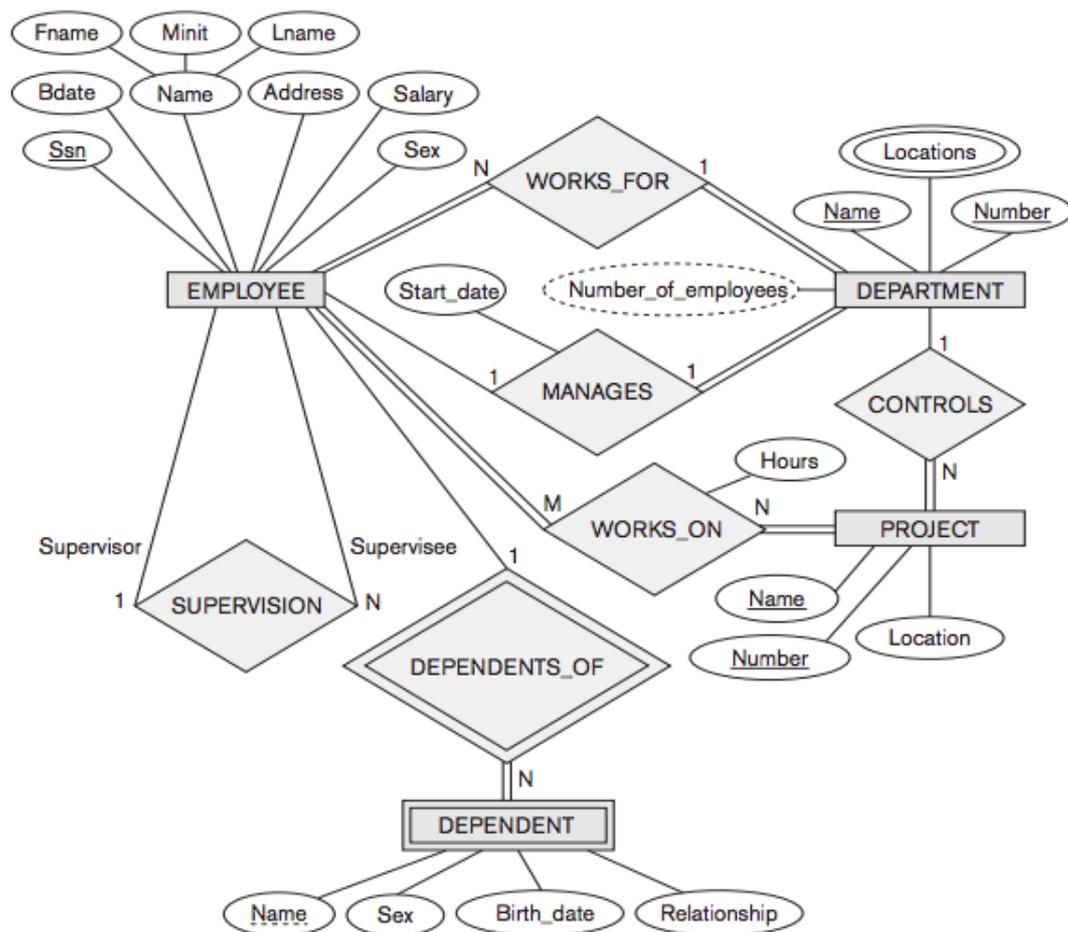

Suppose that after the requirements collection and analysis phase, the database designers provide the following description of the miniworld – the part of the company that will be represented in the database.

### Question

- The company is organized into departments. Each department has a unique name, a unique number, and a particular employee who manages the department. We keep track of the start date when that employee began managing the department. A department may have several locations.
- A department controls a number of projects, each of which has a unique name, a unique number, and a single location.
- We store each employee's name, Social Security number,<sup>2</sup> address, salary, sex (gender), and birth date. An employee is assigned to one department, but may work on several projects, which are not necessarily controlled by the same department. We keep track of the current number of hours per week that an employee works on each project. We also keep track of the direct supervisor of each employee (who is another employee).
- We want to keep track of the dependents of each employee for insurance purposes. We keep each dependent's first name, sex, birth date, and relationship to the employee.

Represent the above in a ER diagram.

## Company Solution

In our example, we specify the following relationship types:

**MANAGES**, which is a 1:1 (one-to-one) relationship type between **EMPLOYEE** and **DEPARTMENT**. **EMPLOYEE** participation is partial. **DEPARTMENT** participation is not clear from the requirements. We question the users, who say that a department must have a manager at all times, which implies total participation. The attribute **Start\_date** is assigned to this relationship type.

**WORKS\_FOR**, a 1:N (one-to-many) relationship type between **DEPARTMENT** and **EMPLOYEE**. Both participations are total.

**CONTROLS**, a 1:N relationship type between **DEPARTMENT** and **PROJECT**. The participation of **PROJECT** is total, whereas that of **DEPARTMENT** is determined to be partial, after consultation with the users indicates that some departments may control no projects.

**SUPERVISION**, a 1:N relationship type between **EMPLOYEE** (in the supervisor role) and **EMPLOYEE** (in the supervisee role). Both participations are determined to be partial, after

the users indicate that not every employee is a supervisor and not every employee has a supervisor.

WORKS\_ON, determined to be an M:N (many-to-many) relationship type with attribute Hours, after the users indicate that a project can have several employees working on it. Both participations are determined to be total.

DEPENDENTS\_OF, a 1:N relationship type between EMPLOYEE and DEPENDENT, which is also the identifying relationship for the weak entity type DEPENDENT. The participation of EMPLOYEE is partial, whereas that of DEPENDENT is total.

A weak entity type normally has a partial key, which is the attribute that can uniquely identify weak entities that are related to the same owner entity. In our example, if we assume that no two dependents of the same employee ever have the same first name, the attribute Name of DEPENDENT is the partial key. In the worst case, a composite attribute of all the weak entity's attributes will be the partial key.

In ER diagrams, both a weak entity type and its identifying relationship are distinguished by surrounding their boxes and diamonds with double lines. The partial key attribute is underlined with a dashed or dotted line.
